Relative performance

Relative performance

Structure	P [MW] @ $T = 70 \text{ ns}$ $BDR = 10^{-3}$	E [MV/m] @ $T = 70 \text{ ns}$ $BDR = 10^{-3}$	$P T^{1/3}/c$ [Wu] @ $T = 70 \text{ ns}$ $BDR = 10^{-3}$
30CNSD2P3CU	20.2 (0.92)	91.6 (1.32)	7.6 (1.06)
30CNSD1P2CU	21.9 (1.00)	69.5 (1.00)	7.2 (1.00)
30HDS60LCU	16.1 (0.74)	60.8 (0.87)	5.6 (0.78)
30HDS60SCU	13.3 (0.61)	74.5 (1.07)	5.5 (0.76)
30HDSTKCU	13.5 (0.62)	90.1 (1.30)	5.1 (0.71)

Conclusion

- Performance of the two circular structures tested scales well with P/C (although, P by itself could also be used).
- Assuming P/C scaling, other differences between the structures are less relevant:
 - Surface preparation
 - Conditioning strategy
 - Other rf characteristics
- HDS structures seem to perform systematically worse than circular structures in terms of P/C (but not in E if results for HDS thick are confirmed).

Relative performance
